                                                                                                                                        Matches
                                                                                                                                                                                                                    This polypeptide comprises human preproglucagon. The sequence can be expressed from a PCR-amplified cDNA clone (see AAT75672). RIN rat insulinoma cell lines expressing preproglucagon provided efficient amidation of a secreted, processed polypeptide. The invention provides methods for production of heterologous polypeptides using recombinantly engineered cell lines. Also described are methods of engineering cells for high level expression, methods of large-scale heterologous protein production, and methods for treatment of disease in vivo using viral delivery systems and recombinant cell lines

                                                                                            S
                                                                                                                                                                                                                                       This invention relates to a method for producing mammalian amylin. The method relies on the use of a recombinantly engineered secretory cell line. The method comprises: (a) providing a starting secretory cell that the sare regulated secretory pathway; (b) introducing, into the starting concert; (c) selecting a secretory cell of (b) that exhibits increased production of biologically active amylin as compared to the starting concertory cell; and (d) culturing the selected secretory cell. Amylin is concertory cell; and (d) culturing the selected secretory cell. Amylin is concertory cell; and (d) culturing the selected secretory cell. Amylin is constituted in sullin modulator, and the method results in antidiabetic, hypotensive and osteopathic activity. The amylins produced are useful for regulating blood glucose levels, as well as in modulating the circulating levels of consulin in a mammal. The amylins produced maybe used in treating diabetes mellitus, hypoglycaemia, osteoporosis, Paget's disease, hypercalcaemia, observe, hypertension, or any other disorder requiring amylin regulation. The invention includes cDNA and protein sequences (AAC55760 and AAB26771) representing human amylin. Sequences AAC55716-C55681 and AAB267751

                                                                                                                                                                                                                                                                                                                                          method relies on the use of a recombinantly engineered secretory cell
line. The method comprises: (a) providing a starting secretory cell that
has a regulated secretory pathway; (b) introducing, into the starting
secretory cell, an amylin-encoding gene operatively linked to a first
promoter; (c) selecting a secretory cell of (b) that exhibits increased
production of biologically active amylin as compared to the starting
secretory cell; and (d) culturing the selected secretory cell. Amylin is
can insulin modulator, and the method results in antidiabetic, hypotensive
and osteopathic activity. The amylins produced are useful for regulating
blood glucose levels, as well as in modulating the circulating levels of
insulin in a mammal. The amylins produced maybe used in treating diabetes
mellitus, hypoglycaemia, osteoporosis, Paget's disease, hypercalcaemia,
obesity, hypertension, or any other disorder requiring amylin regulation.
The invention includes cDNA and protein sequences (AAC55760 and AAB26771)
representing human amylin. Sequences AAC55716-C55681 and AAB26765-B26777
mammalin maylin be of the method of the invention for the production of

                                                                                                                                      or biological activity. Human serum albumin is responsible for a significant proportion of the comotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form after the printed specification, but was betained in electronic forms and the printed specification, but was betained in electronic forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; human; gene; ds.

          This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forms that the form with the printed specification, but was obtained in electronic forms that the protein of the printed specification, but was obtained in electronic forms that the form with the protein of the printed specification, but was obtained in electronic forms that the form with the protein of the printed specification, but was obtained in electronic forms that the form with the protein of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         13-AUG-2002;

The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/publishedpct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forms that the printed specification, but was obtained in electronic forms that the printed specification, but was obtained in electronic forms that the printed specification, but was obtained in electronic forms that the printed specification, but was obtained in electronic forms that the sequence is the sequence of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                   serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; human.
                                                                                                                                                                                                                                                                                                      23-DEC-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences
                                                                                                                                                                                                                      albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin for proparing a novel albumin fusion protein on the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences
                                                                                                            albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 180 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (HUMA-)

                                                                                                                                                                  This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a Significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of the therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may callow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein chick was fused with human albumin to create a novel albumin fusion composition. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

                                                                                                                                                                                                                                                                                                                                                       "Conformation of glucagon
FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Natl.

SUBCELLULAR LOCATION: Secreted.
TISSUB SPECIFICITY: Glucagon is secreted in the A c islets of Langerhans. GLP-1, GLP-2, oxyntomodulin a are secreted from enteroendocrine cells throughout
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          similarity).
SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cell proliferaton (By similarity).

FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases mucosal permeability (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTM: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSXZ/PC2. In the intestinal L cells PCSXL/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 \epsilon GLP-2 are induced in response to nutrient ingestion (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           similarity). ```
-II-FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-I-FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxycocin, and vasopressin (By similarity).

-I-FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The principal target for GLP-2 action. Plays a key role in mutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient mucosal permeability (By similarity).

-I-FUNCTION: Glicentin may modulate gastric acid secretion and gastro-duodenal activity (By similarity).

-I-FUNCTION: Glucagon is secreted in the A cells of the slets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glicentin are secreted from entercendocrine cells throughout the gastrointestinal tract. GLP1 and GLP2 are also secreted in selected neurons in the brain.

-I-INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 and similarity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drucker D.J.;

homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the
```

<u>:</u> gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and dec mucosal permeability (By similarity) regulate the hypothalamic pituitary axis (HPA) via effects on TSH, CRH, oxytocin, and vasopressin (By similarity). FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increase insulin release. Play important roles on gastric motility a suppression of plasma glucagon levels. May be involved in t suppression of satiety and stimulation of glucose disposal peripheral tissues, independent of the actions of insulin growth-promoting activities on intestinal epithelium. May a growth-promoting activities on intestinal epithelium. crypt cell proliferation and decreased enterocyte apoptosis. gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutris homeostasis, enhancing nutrient assimilation through enhanced assimilation through enhanced with increased May also nutrient E

FUNCTION: Oxyntomodulin significantly reduces food intake (By

gastric acid secretion and

similarity).

FUNCTION: Glicentin may modulate gastric acid secretion gastro-pyloro-duodenal activity.

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: Glucagon is secreted in the A cells islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and care secreted from entercendocrine cells throughout the gastrointestinal tract. GLP1 a selected neurons in the brain. GLP1 and GLP2 are also secreted in cells of the and glicentin

INDUCTION: Glucagon release is stimulated by hypoglycemia inhibited by hyperglycemia, insulin, and somatostatin. GL GLP-2 are induced in response to nutrient ingestion (By GLP-1 and and

<u>:</u> similarity).

PTM: Proglucagon is posttranslationally processed in a tissueprofice manner in pancreatic A cells and intestinal L cells. In
pancreatic A cells, the major bioactive hormone is glucagon
cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1
liberates GLD-1, GLD-2, glicentin and oxyntcomodulin. GLD-1 is
further N-terminally truncated by posttranslational processing in
the intestinal L cells resulting in GLD-1(7-37) GLD-1-(7-36) amide.
The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (Ву

residues at C-terminus as in other mammmals. SIMILARITY: Belongs to the glucagon family. MISCELLANEOUS: GLP-2 does not have cleavage 8 b pair of basic

hypoglycemia (By similarity).

-!- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta cell proliferaton (By similarity).

-!- FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterceyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decrease mucosal permeability (By similarity).

Specific meaner in pancreatic A cells and intestinal L cells. In specific meaner in pancreatic A cells pancreatic A cells. In cells pcskx/PC2. In the intestinal L cells pcskx/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                         gastrointestinal tract. GLP1 and GLP2 are also secreted in selected neurons in the brain. INDUCTION: Glucagon release is stimulated by hypoglycemia inhibited by hyperglycemia, insulin, and somatostatin. GLP-2 are induced in response to nutrient ingestion (By

FUNCTION: Glucagon plays a key role in glucose metabolism and homeostasis. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satisty and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH,
                                                                                                                                                              glucagon-like peptides.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          villus height in the small intestine, concomitant with increase crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutries homeostassis, enhancing nutrient assimilation through enhanced necessaries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 INDUCTION: Glucagon release is inhibited by hyperglycemia, in GLP-2 are induced in response similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mass through stimulation of islet cell proliferaton (By similarity) FUNCTION: GLP-2 stimulates intest

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: GLP-2 stimulates intestinal growth and up-regulates villus height in the small intestine, concomitant with increased crypt cell proliferation and decreased enterocyte apoptosis. The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decreases mucosal permeability (By similarity).

FUNCTION: Oxyntomodulin significantly reduces food intake (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric motility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth-promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet mass through stimulation of islet neogenesis and pancreatic beta repulator (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          similarity)

          crypt cell proliferation and decreased entercoyte apoptosis. I gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrien homeostasis, enhancing nutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient disposal. Stimulates intestinal glucose transport and decrease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibits gastric emptying in humans. Suppression of gastr emptying may lead to increased gastric distension, which contribute to satiety by causing a sensation of fullness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Oxyntomodulin significantly reduces Inhibits gastric emptying in humans. Regulates blood glucose by increasing gluconeogenesis and decreasing glycolysis. A counterregulatory hormone of insulin, raises plasma glucose levels in response to insulin-induced hypoglycemia (By similarity).

-!- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent insulin release. Play important roles on gastric metility and the suppression of plasma glucagon levels. May be involved in the suppression of satiety and stimulation of glucose disposal in peripheral tissues, independent of the actions of insulin. Have growth promoting activities on intestinal epithelium. May also regulate the hypothalamic pituitary axis (HPA) via effects on LH, TSH, CRH, oxytocin, and vasopressin secretion. Increases islet that the secretion of the stimulation of selet processes is let the secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "The glucagon-like peptides.

The gastrointestinal tract, from the stomach to the colon is the principal target for GLP-2 action. Plays a key role in nutrient homeostasis, enhancing mutrient assimilation through enhanced gastrointestinal function, as well as increasing nutrient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: Proglucagon is posttranslationally processed in a tissue-specific manner in pancreatic A cells and intestinal L cells. In pancreatic A cells, the major bioactive hormone is glucagon cleaved by PCSKZ/PC2. In the intestinal L cells PCSKI/PC1 liberates GLP-1, GLP-2, glicentin and oxyntomodulin. GLP-1 is further N-terminally truncated by posttranslational processing in the intestinal L cells resulting in GLP-1(7-37) GLP-1-(7-36) amide. The C-terminal amidation is neither important for the metabolism of GLP-1 nor for its effects on the endocrine pancreas (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             INDUCTION: Glucagon release is stimulated by hypoglycemia and inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 GLP-2 are induced in response to nutrient ingestion (By
